

ABOUT GIT

- git is a very useful tool for software engineers as a VCS(Version Control System). It can keep all histories you have done to your code. But it is different to svn or CVS. It can all the histories and logs on your local machine too. It means that you can commit everything locally without network connections. When you can connect to your remote repository, you can upload all the commits you have made locally. You can also revert to an specific version locally. You can make a local branch with network connections too. All the things you can do is that:

- create / delete a branch
- revert to a specific version
- view all logs
- commit your changes, store logs locally

-
